

## 1901. Find a Peak Element II

Medium

A **peak** element in a 2D grid is an element that is **strictly greater** than all of its **adjacent** neighbors to the left, right, top, and bottom.

Given a **0-indexed**  $m \times n$  matrix `mat` where **no two adjacent cells are equal**, find **any** peak element `mat[i][j]` and return *the length 2 array* `[i, j]`.

You may assume that the entire matrix is surrounded by an **outer perimeter** with the value `-1` in each cell.

You must write an algorithm that runs in  $O(m \log(n))$  or  $O(n \log(m))$  time.

**Example 1:**

-1	-1	-1	-1
-1	1	4	-1
-1	3	2	-1
-1	-1	-1	-1

**Input:** `mat = [[1,4],[3,2]]`

**Output:** `[0,1]`

**Explanation:** Both 3 and 4 are peak elements so `[1,0]` and `[0,1]` are both acceptable answers.

**Example 2:**

-1	-1	-1	-1	-1
-1	10	20	15	-1
-1	21	30	14	-1
-1	7	16	32	-1
-1	-1	-1	-1	-1

**Input:** `mat = [[10,20,15],[21,30,14],[7,16,32]]`

**Output:** `[1,1]`

**Explanation:** Both 30 and 32 are peak elements so `[1,1]` and `[2,2]` are both acceptable answers.

**Constraints:**

- `m == mat.length`
- `n == mat[i].length`
- `1 <= m, n <= 500`
- `1 <= mat[i][j] <= 105`
- No two adjacent cells are equal.
